

CLAIMS

1. A driver circuit for an EL display panel comprising:
reference current generating means of generating a
reference current;

a first current source which is fed the reference current
from the reference current generating means and outputs a first
current which corresponds to the reference current to a
plurality of second current sources;

the second current sources which are fed the first current
outputted from the first current source and output a second
current which corresponds to the first current to a plurality
of third current sources; and

the third current sources which are fed the second current
outputted from the second current sources and output a third
current which corresponds to the second current to a plurality
of fourth current sources,

characterize in that among the fourth current sources,
an appropriate number of unit current sources are selected
according to input image data.
